The Canning of Fish and Meat May 19 2021 Canning as a preservation process has proved its value in its contribution to the preservation, distribution, and storage of world food supplies, and is a traditional way of preserving fish and meat. With increasing concern for the environment, it has much to offer with its use of readily recyclable container materials and product stability at ambient conditions, as well as long life. For some foods, such as fish and meat, the character of the canned product has become an accepted and sought after quality by the consumer but for other foods, other methods of preservation have delivered a 'fresher' character. However, there is a growing realisation that these other methods of preservation of foods carry critical control requirements through the whole distribution chain,

which, considered together with environmental implications of energy usage and packaging recycling potential, has led to a resurgence of interest in canning. Increasingly, in the major markets, legislative control of fish canning is following (and extending) the style previously only applied to canned meat, with enormous implications for fish canneries worldwide.

Preservation of Library & Archival Materials Jul 21 2021 Provides the basic, practical information needed to plan and implement sound collections care programs or incorporate preservation principles into an existing program.

Methods in Rock Magnetism and Palaeomagnetism Oct 12 2020 During the last 30 years the study of the magnetic properties of rocks and minerals has substantially contributed to several fields of science. Perhaps the best known and most significant advances have resulted from the study of palaeomagnetism, which led to quantitative confirmation of continental drift and polar wandering through interpretation of the direction of remanent magnetism observed in rocks of different ages from different continents. Palaeomagnetism has also, through observations of reversals of magnetization, ancient secular variation and ancient field intensities provided data relevant to the origin of the geomagnetic field, and other investigations have contributed significantly to large-scale and local geological studies, the dating of archaeological events and artefacts and more recently to lunar and meteoritic studies. Rock and mineral magnetism has proved to be an interesting study in its own right through the complex magnetic properties and interactions observed in the iron-titanium oxide and iron sulphide minerals, as well as contributing to our understanding of remanent magnetism and magnetization processes in rocks. Simultaneous with the development of these studies has been the development of instruments and techniques for the wide range of investigations involved.

Electrohydrodynamic Patterning of Functional Materials Aug 29 2019 This thesis explores a route to induce and control the structure formation process in thin films by the use of strong electric fields. We investigate, establish and apply the use of the electrohydrodynamic (EHD) lithography as a versatile patterning tool on the sub-micrometre and nanometre length scales for functional materials. Thin films are ubiquitous, they are found in nature and used in almost every aspect of daily life. While film instabilities are often undesirable in nature and technology, they can be utilized to produce structures by precisely controlling the destabilization of the film. EHD lithography utilizes instabilities induced by means of an electric field to fabricate periodic structures. EHD patterning is set to become a competitive candidate for low-cost lithographic technology for a number of applications. Herein, the applied potential of this lithographic process is explored by expanding its applicability to a broad range of materials and by a simultaneous patterning of multilayer systems or functional polymers yielding hierarchical architectures with novel functionalities. EHD pattern formation enables for

instance, the fabrication of multi-scale structured arrays as surface enhanced Raman scattering (SERS)-active platforms. Furthermore, crystalline and conductive polymers are patterned using the EHD approach and the underlying structure formation mechanisms are discussed. This extension towards functional material systems offers interesting prospects for potential applications. Findings of this thesis are very promising for use in optoelectronic devices.
